Almost 1 000 000 households all around the world enjoy ROMOTOP products today. Every product that leaves the production plant in Suchdol nad Odrou is a result of the joint effort of all our employees. Our state-of-the-art production facilities, competent employees and qualified professional sales representatives make ROMOTOP one of the leading brands in its field in Europe. ROMOTOP stoves and inserts offer customers a modern design, high-quality technical workmanship and an innovative wood burning process. A wide range of products cater to the needs of both standard and low-energy houses. Heat energy can be stored in accumulation tiles or distributed around the house using hot-water exchangers. Customers can select from hand-made ceramic or natural stone tiling.

Technology is our passion; it's what we live for. Thanks to natural development, we know it's not enough for leaders in the field to simply build on the wisdom and experience of our ancestors. It's our respect for our ancestors that drives us to push the limits, just like they did before us. Where others speak of skills, history and tradition, we are continually thinking of new patents, innovations, state-of-the-art production technologies, efficiency, production rhythms and robotic automation.

## TECHNOLOGY AND DESIGN OF FUTURE

## Energy labels

People have been using fire to provide heat for thousands of years. From times of open fireplaces of our ancestors compared to modern fireplace stoves however, lot has changed.

Current trend demands ecological and economic heaters which will succeed even in the future, and these are exactly the fireplace stoves and fireplace inserts of Romotop.

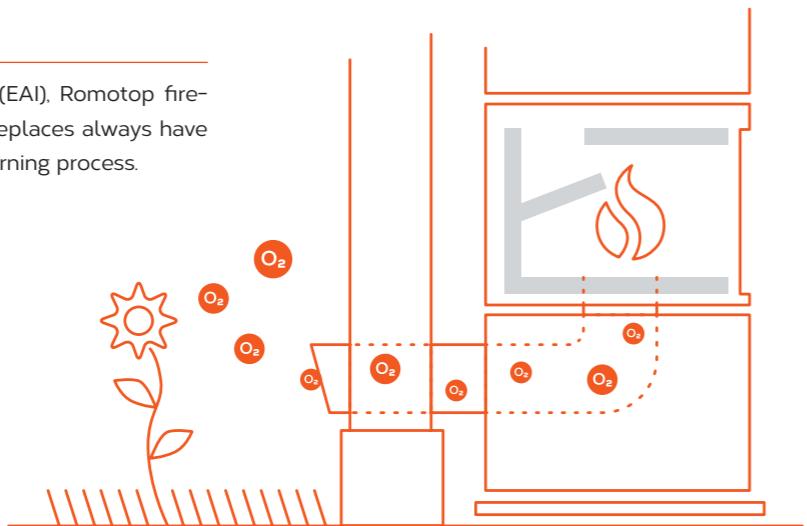

Based on the European directive we have marked each of our products with energy label. Timeless and sophisticated design ensures that our fireplace stoves and inserts are very effective and ecological heater.

A<sup>+</sup>

# Technology

## Always enough oxygen

Thanks to the external air intake (EAI), Romotop fireplace stoves, inserts and design fireplaces always have sufficient combustion air for the burning process.

## Precise and simple air control

Just like you, Romotop fireplace stoves, inserts and design fireplaces need air to function properly. Primary air helps the wood catch fire, while secondary air keeps the glass perfectly clean. The supply of both primary and secondary air can be controlled by a single element. Everything is designed for your maximum comfort.

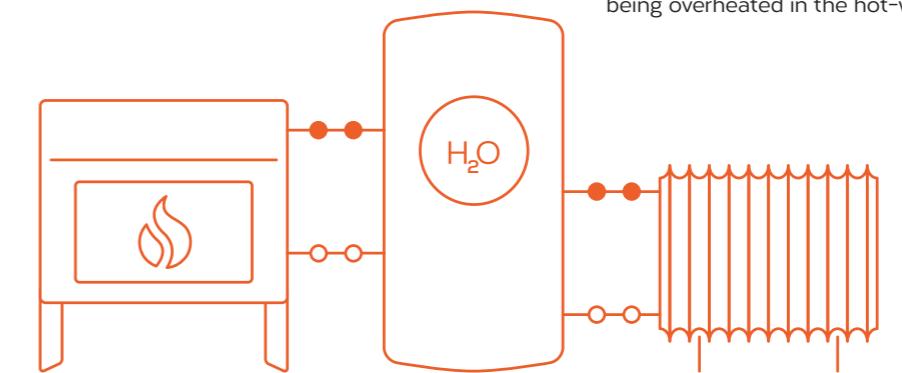

## Better combustion dynamics

We always offer only the best. This is also true of the chamotte brick in the combustion chamber, which are characterized by high material stability, better combustion, accumulation properties and improved combustion dynamics.

## Fireplace stoves and inserts with a hot-water exchanger

Romotop fireplace stoves and inserts with a hot-water exchanger offer high combustion efficiency and low heating costs. In combination with an accumulation tank, they can be used as the primary source of heating. For maximum operating safety, fireplace stoves and inserts with a hot-water exchanger are equipped with a cooling loop with thermal valve, which prevents water being overheated in the hot-water exchanger.

Accumulation set,  
the weight = 66 kg

## Cara R/L 03

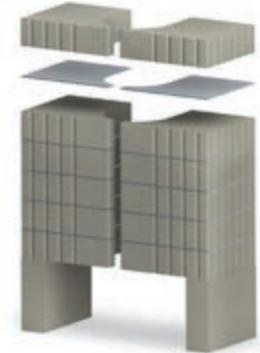

The Cara R/L is a high quality fireplace which combines varnished metal sheeting and glass, while the whole geometry of the combustion chamber is based on the letter "L". The above-standard size of the glass in this corner stove offers a perfect view of the flames from multiple angles.

## Stoves are beautiful and radiate heat for a long time

The Czech company ROMOTOP, a leader in the field of wood burning stoves, introduced the new and unique design stoves **Cara C 02, Cara CS 02, Cara C N 03, Cara CS N 03, Cara L/R 03, Variant F N 03, Variant RN/LN 03 with heat accumulation**, characterized by a top design and that "extra something". In this case the "extra something" is the stove's ability to accumulate (store) generated heat and radiate it over a long period of time.

**Design stoves Cara and Variant with heat accumulation** is a truly luxurious product. This stove represents a new trend, where steel create a pleasant yet representative impression.

Graph shows stoves temperatures depending on the time of last stoke

Regular stoves provide large amounts of heat to their surroundings for a short time after stoking and their performance, as well as the temperature in the room, decreases quickly after the fire dies. With a carefully configured ratio of convection and accumulation, design stoves are designed to ensure both a relatively quick increase in temperature in the room after stoking, as well as lasting for a long time, heating the air for up to another **13 hours** after final stoking.

The **Luanco N A, Lugo N A and Malaga N 03 stove with accumulation** extends the duration of heat radiation from the stove to up to **8.5 hours**, thanks to its accumulation elements. The **Esquina N, Evora A, Laredo A stove, with accumulation elements**, radiates heat for up to **5.5 hours**.

Stoves allow you to keep a regular modern low-energy house warm for the whole day, while you are away.

## Smart handle

Naturally, all ROMOTOP stoves comply with the conditions of the BAUART 1 standard. The door of the furnace is always closed, except when the stove is being operated. The closed door condition is achieved by means of a self-closing door that gets latched by itself thanks to its spring-loaded hinges and a return spring.

But if the stove is out of operation at the moment, this may be a disadvantage e.g. during maintenance or cleaning.

**But here comes the “ROMOTOP smart handle”.**

With the new SORIA, BELO 3S and BELORADO models you can completely open the door, fix (secure) the handle and the door will be locked in the open position.

**This way you can e.g. do the cleaning quite easily.**
